

INSTRUCTIONS for the INSTALLATION and USE

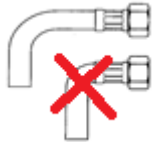

Warning:

An incorrect installation or use of the hose can compromise the correct function of the system to which the hose is connected and it can create an uncontrolled flow of water. It could cause serious and expensive damage, in particular if the leakage is not promptly detected.

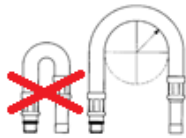

Instructions for the installer:

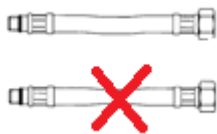

Before connecting the hose, check that both fittings are correctly crimped

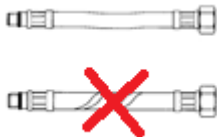

Avoid bending the hose next to the ferrule. Keep it straight for at least a length of 1.5 times the outer diameter of the hose

Avoid bending the hose with radiuses smaller than what is prescribed by the technical data sheet of the product

Do not over-stress the hose

Do not twist the hose

Use a wrench whose size is adequate to the dimension of the fittings. Do not tighten the nuts with a force of more than 5 Nw. Plastic fittings must be screwed by hand.

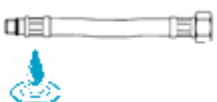

Instructions for the user:

Always close the water tap after use, in order to avoid leaving the inlet hose with pressure

Avoid the contact with sharp or cutting objects

Periodically check the hose and eventually replace it if:

- There is a leakage
- There are signs of corrosion or damage
- Do not use the same hose if the appliance is replaced

Protect the hoses from eventual damages:

- Avoid contact with extreme heat sources (over 150°F / 65°C)
- Avoid contact with household cleaning products of any type
- Clean with water only
